

De Agostini also on mobile devices

Login to the site on mobile devices.
Point the videocamera of your mobile phone on the **QR** on the right.

What is a QR Code?

It is a bar code bidimensional (one matrix) that can contain various information, for example a URL web address.

QR means 'Quick Response'.

A software to read the QR code must have been installed on the mobile phone. If your mobile phone can scan the QR code, the browser of your phone will automatically connect to the website in the code.

Access Keys

What are access keys?

Access keys are keyboard shortcuts that enable to quickly access a website link.

Usually the link connects to a main page of the website. However they can be used to quickly access the research box or return to the beginning of the main content of the page.

Access keys are a combination of keyboards that vary depending on the browser, also in different versions of the same browsers. The following are the most common browsers in use.

Access key	Fuction	Access key	Fuction	Access key
H	Home Page De Agostini Fondation	• E	Review	• Y
G	The group	• J	Photo gallery	•
N	Profile	• Q	Contacts	•
M	History	• U	Our values	•
R	Press Releases	• K	Art & culture	•

Mozilla Firefox

Mozilla Firefox use combination **ALT + SHIFT+ ACCESSKEY**.

When pressing the access key the selected link will open immediately.

In previous versions the combination did not require the **SHIFT** key. It was modified to avoid the overlap of access keys and functions of the bowser menu.

In fact, as in the case of Windows' users, the ALT key can also open main menus or other functions, and this could cause confusion.

For **MAC** users are using the combination **CTRL + ALT + ACCESSKEY**.

Internet Explorer

 **Internet Explorer** use the combination **ALT + ACCESSKEY**, though in this case the links are only selected, to access the page the RETURN key must be pressed. In Internet Explorer there may be some problems using the **ALT** key as it is also used for the main menu. So the access keys can overlap with the browser menu. Moreover in Internet Explorer 6, the combination **ALT+D** gives access to the website browser box allowing users to insert a URL.

Safari

 **Apple safari** uses the combination of **ALT+ ACCESSKEY** that sends directly to the required link, starting from version 2.0. For **MAC** users are using the combination **CTRL + ALT + ACCESSKEY**.

Google Chrome

 **Google Chrome** uses the combination of **ALT+ ACCESSKEY** that sends directly to the required link. For **MAC** users are using the combination **CTRL + ALT + ACCESSKEY**.

Opera

 **Opera** uses the combination of **SHIFT+ESC+ACCESSKEY** that links directly to the required page. Opera has also an interesting feature: after pressing **SHIFT+ESC** a box with a list of all the website access keys will appear at the centre of the page.

Other browsers for Windows including old browsers (i.e. Netscape) and other previous versions of the browsers described above use the combination of **ALT+ACCESSKEY**. In general Mac or Linux use the **CTRL+ACCESSKEY** combination.
